

## [Technical Data] Selection of Single Axis Actuators 1

Select the nominal SX actuator from the travel and the rating list below.

Determine the ball screw lead so that the operation speed will be within the maximum speed shown in (Table 4). At this stage, the selection is temporary.

Examine the load applied to the rail and put it in formulas (1) and (2) on page A-058 Obtain the equivalent load  $F_e$  for each process and put it in formula (3) on page A-058 Obtain the average load  $F_m$  and calculate the lifetime.

Examine the load applied to the ball screw and the support bearing. Put it in formula (3) on page A-058 obtain the average load  $F_m$  and calculate the lifetime.

## Life Span

For the SX actuator, calculate the life span of the rail, ball screw and support bearing. The actuator life span is determined to be the smallest value from among these results.

Load mass : W kg  
 Stroke : Ls mm  
 Acceleration : a mm/s<sup>2</sup>  
 Maximum speed : v mm/s  
 Gravity : g=9.81m/s<sup>2</sup>  
 acceleration : Horizontal  
 Speed diagram : (Fig. 1)  
 Operating conditions : (Fig. 2)

## Examination Selection

Select the temporary model number based on the load mass W (kg) and the maximum speed V (mm/s). Then prepare a speed diagram based on the acceleration, maximum speed and travel. The conditions that can develop this speed diagram will serve as the basis for the selection calculation.

## Calculation Lifetime Calculation Example

Examine the status of the load applied (Fig. 2) to the rail of the SX actuator. Put each load in the formula below (formula (1) for single nut block specifications and formula (2) for double nut block specifications), and obtain the equivalent load Fe.

### Equivalent Load

•In the case of single block

$$F_e = Y_H F_H + Y_V F_V + Y_p K_p M_a + Y_y K_y M_b + Y_r K_r M_c \quad (1)$$

•In the case of double block

$$F_e = Y_H F_H / 2 + Y_V F_V / 2 + Y_r K_r M_a + Y_p K_p M_b + Y_y K_y M_c \quad (2)$$

Fe : Equivalent Load  
 FH : Horizontal load acting on blocks  
 Fv : Vertical load applied to the block  
 Ma : Pitching direction moment applied to the block  
 Mb : Yawing direction moment applied to the block  
 Mc : Rolling direction moment applied to the block  
 Kp : Equivalent coefficient for pitching direction moment  
 Ky : Equivalent coefficient for yawing direction moment  
 Kr : Equivalent coefficient for rolling direction moment  
 YH, YV, Yp, Yy, Yr: 1.0 or 0.5

When the actuator is used under moment loads, calculate the load by multiplying the guide moment equivalent coefficient in Table 2. In formulas (1) and (2), in order to obtain the equivalent load Fe, the maximum value among FH, Fv, KpMa, KyMb and KrMc is determined to be 1.0, and the remaining items are set at 0.5.

### Average Load

As Ma and Mb for the SX actuator vary with acceleration and deceleration, obtain the average load Fm from formula (3).

$$F_m = \sqrt[3]{\frac{1}{L_s} (F_e^3 \cdot L_1 + F_e^2 \cdot L_2 + F_e^3 \cdot L_3 + \dots + F_e^3 \cdot L_n)} \quad (3)$$

Fm: Average load for fluctuating loads (N) L: Total travel distance (km)

### Rail Life Span

Obtain the rail life span for the SX actuator from formula (4).

$$L = L_a \times \left( \frac{C}{f_w \cdot F_m} \right)^3 \quad (4)$$

L: Rail lifetime (km) La: Travel distance (km) fw: Load coefficient  
 C: Basic dynamic load rating (N)

When the travel length and the number of reciprocal motions per minute are constant, the number of life span hours can be calculated from formula (5).

$$L_h = \frac{L \times 10^6}{2 \cdot \ell_s \cdot n_1 \times 60} \quad (5)$$

Lh: Life span hours (h) ls: Travel (mm) n1: Reciprocal motions per minute

### Life span of ball screw and support areas

Obtain the average load from the load applied in the axial direction. Calculate life span for both ball screws and bearings from formula (6). Obtain the average load from formula (3).

$$L_r = \left( \frac{C_a}{f_w \cdot F_m} \right)^3 \cdot \ell \times 10^6 \quad (6)$$

Lr: Life span of ball screw (km) l: Ball screw lead (mm)  
 fw: Load coefficient Ca: Basic dynamic load rating of screw and support (N)

### Rated lifetime calculation example

#### 1 Model number for examination

Operating conditions : SX26

Rail : C (Basic dynamic load rating)=6522N Co (Basic static load rating)=11871N

Ball screw : Ca (Basic dynamic load rating)=1712N Coa (Basic static load rating)=2251N

Support bearings : Ca (Basic dynamic load rating)=1637N Poa (Basic static load rating)=1205N

Load mass : 10kg

Maximum speed : 250mm/s

Acceleration : 833mm/s<sup>2</sup>

Stroke : 200mm

Gravity : g=9.81m/s<sup>2</sup>

Position : Horizontal

Speed diagram : (Fig. 1)

Operating Conditions : (Fig. 2)

#### 2 Examination

##### Temporary selection

Use a travel distance of 200 mm with an acceleration of 833 mm/s<sup>2</sup> and a maximum speed of 250 mm/s. Based on these conditions, assume that the SX26 series is used. (The selection software can be used on the Misumi website after customer registration has been completed.)

#### 3 Calculation

##### 3-1 Examination of rail

Multiply the moment equivalent coefficient in the table with the load according to the condition in which one nut block is used.

##### Load for nut block

1) At constant speed

$$Fe_1 = Y_v F_v = Y_v \cdot W \cdot g = 1 \cdot 10 \cdot 9.81 = 98.1 \text{ (N)}$$

2) At acceleration

$$Fe_2 = Y_v F_v + Y_p K_p M a = 0.5 \cdot 98.1 + 1 \cdot 0.17 \cdot 70 \cdot 0 = 60.95 \text{ (N)}$$

3) At deceleration

$$Fe_3 = Y_v F_v + Y_p K_p M a = 0.5 \cdot 98.1 + 1 \cdot 0.17 \cdot 70 \cdot 0 = 60.95 \text{ (N)}$$

Static safety coefficient

$$f_s = \frac{C_o}{F_{max}} = \frac{C_o}{W \cdot g} = \frac{11871}{98.1} = 121.1$$

##### Rated life span

Axial average load

$$F_m = \sqrt[3]{\frac{1}{L_s} (Fe_1^3 \cdot L_1 + Fe_2^3 \cdot L_2 + Fe_3^3 \cdot L_3 + \dots + Fe_n^3 \cdot L_n)} = 87.72 \text{ (N)}$$

Rated life span

$$L = \left( \frac{C}{f_w \cdot F_m} \right)^3 \times 50 = 11.89 \times 10^6$$

f<sub>w</sub>: Load coefficient 1.2  
L<sub>a</sub>: Travel distance

##### 3-2 Examination of ball screw

Obtain the axial loads for the parts and the average load from the speed diagram.

##### Lifetime of ball screw

Axial load

1) At constant speed

$$Fe_1 = \mu \cdot W \cdot g = 0.01 \times 10 \times 9.81 = 0.981 \text{ (N)}$$

2) At acceleration

$$Fe_2 = Fe_1 + W \cdot a \times 10^{-3} = 0.981 + 10 \cdot 0.833 = 9.311 \text{ (N)}$$

3) At deceleration

$$Fe_3 = Fe_1 - W \cdot a \times 10^{-3} = 7.352 \text{ (N)}$$

Static safety coefficient

$$f_s = \frac{C_{oa}}{F_{max}} = \frac{C_{oa}}{Fe_2} = \frac{2251}{9.311} = 241.76$$
